```

The invention relates to novel human molecules for disease detection and treatment (mddt proteins) and the polynucleotides encoding them. The MIDT polynucleotides and polypeptides are useful for diagnostic and therapeutic purposes e.g. to diagnose and treat cell proliferative disorders (e.g. arteriosclerosis, cirrhosis and psoriasis) cancers (e.g. adenocarcinoma, leukaemia and breast cancer) autoimmune disorders (e.g. acquired immunodeficiency syndrome (AIDS) and Addison's disease) diabetes mellitus, asthma, multiple sclerosis, osteoarthritis, and many more diseases given in the specification. The present sequence encodes an mddt protein of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                В
             converting enzyme is a zinc metallopeptidase that plays roles in blood pressure regulation and fertility. Zace2 can be expressed by standard recombinant methodology. Zace2 polypeptides are useful for treating an inflammatory bowel disease (e.g. Crohn's disease and ulcerative colitis), diseases associated with inflammation like arthritis and enterocolitis, as targets for identifying modulators of zinc protease activity, for screening or identifying new angiotensin-converting enzyme (ACE) inhibitors, and as a basis for rational drug design for inhibitory molecules. The nucleic acids can be used to detect the expression of a Zace2 gene in a biological sample, as probes for in vivo diagnosis and for detecting and localizing Zace2 gene expression in tissue samples, to detect and to detect abstraction sassociated with the Zace2 locus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Disclosure; Page 112-113; 125pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to the metalloenzyme Zace2. Zace2, an angiotensin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Angiotensin-converting enzyme, Zace2, useful for treating inflammatory bowel disease, e.g. Crohn's disease and ulcerative colitis, or diseases associated with inflammation such as arthritis and enterocolitis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Piddington
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    zinc metallopeptidase; blood pressure; zinc protease; hypertension; ventricular systolic dysfunction; renal impairment; heart failure; scleroderma renal crisis; atherosclerosis; antiinflammatory; mouse; antiarthritic; bradykinin inactivator; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A bank of human testicular cDNA in Lambda gtll was screened with a probe containing the final 3248 nucleotides of endothelial ACE. The complete sequence of tACE was reconstructed from 4 separate clones. It encodes a 711 amino acid mature protein and a 21 residue signal peptide. The 228-2224 sequence is identical to the 1944-9940 region of endothelial ACE. The isolated nucleic acid sequence is inserted into a plasmid for expression of polypeptides. The invention also covers parts of the sequence comprising all or part of the 29-229 sequence, any sequence differing from tACE only by silent substitutions and nucleic acids which hybridise to tACE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 2477 BP; 536 A; 811 C; 695 G; 435 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 В
                                                                                                                                                                                                                                                                                                                                              receptors 1 and 2. The method comprises determining the sequence at one or more polymorphic positions within these genes, and comparing the pattern of polymorphisms from the individual with a reference polymorphic pattern obtained from a population of individuals exhibiting a predetermined cardiovascular disease status. The polymorphic markers are useful for determining the predisposition of an individual to cardiovascular disorders such as myocardial infarction, unstable angina, hypertension, atherosclerosis and stroke. They are also useful for predicting the likely cardiovascular status of a pattent given a treatment regimen comprising administration of cardiovascular drugs (e.g., ACE inhibitors, beta-adrenergic receptor antagonists (beta-blockers) or calcium channel blockers). One or more polymorphic markers provides a basis for predicting the outcome of a treatment regimen.
Fragments of the genes comprising a polymorphic site may be used as primers and probes for detecting genetic polymorphisms or in molecular library arrays for high throughput screening. The genes, and the proteins they encode are useful in the screening of potential cardiovascular drugs. Determination of an individual's polymorphic pattern reduces or eliminates trial and error in selecting a treatment for a particular individual cardiovascular patient. It also provides the ability to eliminate patients from clinical trials who are predicted to be non-responsive, or at a risk for an adverse response, to a particular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    genes encoding angiotensin-converting enzyme (ACE), angiotensin II receptor type 1 (AT1) and type 2 (AT2), angiotensinogen (AGT), renin, aldosterone synthase, endothelin receptor type A and beta-adrenergic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Angiotensin-converting enzyme gene; ACE; coding region; polymorphism; polymorphic marker; cardiovascular disease; myocardial infarction; unstable angina; hypertension; atherosclerosis; stroke; prognosis;

Adverse results in an early trial can be evaluated to identify polymorphic patterns so that the adverse results can be correlated with a sub-population of the test population, permitting exclusion of such sub-populations from the treatment group. Beneficial drugs can be approved for use in the appropriate population, thereby decreasing the number of patients required for a clinical trial, which in turn decreases the duration and cost of such trials. Sequences A38328 and A38330 represent, respectively, intron 16 and the coding region of the human ACE gene (GenBank X62855, J04144). The polymorphic sites identified are 375A/C, 582C/T, 731A/G, 106GG/A, 1215C/T, 2193G/A, 2328A/G, 271G/T, 3132C/T, 3387T/C, 3503G/C, 3906G/A; and a deletion of

New transgenic fly, containing DNA encoding an Abeta portion of human APP, useful for identifying agents which modulate the APP pathway and which can be used to treat Alzheimer's disease -

2002-315796/35

Zusman

Freuler F,

Example 4; Page 93-94; 129pp; English.

The invention relates to a transgenic fly whose genome comprises DNA encoding a polypeptide having the Abeta portion of human amyloid precursor protein (APP), fused to a signal sequence. The DNA sequence encodes a 123 (Abeta40) or 129 (Abeta42) amino acid sequence, given in the specification. The DNA sequence is operably linked to a tissue-specific expression control sequence. Expression of the sequence gives the fly an altered phenotype. The purpose of the invention is for identifying agents that inhibit or promote the expression and/or function of genes or encoded polypeptides which modify the APP pathway. The agent that a compound, triple helix DNA, antisense oligonucleotide, double stranded by the approach of the sequence of the inventor of the sequence of the inventor of the sequence of the sequence of the sequence of genes or encoded polypeptides which modify the APP pathway. The agent that a compound, triple helix DNA, antisense oligonucleotide, double the sequence of stranded RNA molecule, ribozyme, or particularly an antibody. It is used to treat conditions such as Alzheimer's disease. The agent can be used as an APP pathway modulator or in gene therapy. This polynucleotide sequence DNA of the APP related human homologue hCP51674.

In the mature protein the 29 amino acid signal peptide is absent. ACE hydrolyses angiotensin I and/or kinins, most notably bradykinin. Vectors contg. the given sequence are used to produce ACE for therapeutic use eg to hydrolyse kinins implicated in

Consortium/LLNL at: http://lmage.llnl.gov Series: IRAK Plate: 34 Row: i Column: 13
This clone was selected for full length sequencing because it passed the following selection criteria: matched mRNA gi: 11225608
This clone has the following problem: frame shifted.
